WEEKLY HEALTH REPORT

NATURE OF THE DATA

The data presented here are taken from the Statistical Health Reports, Form 86ab, rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States. Troops in transit and certain small detachments are not required to submit reports; for this and other reasons, total strength of reporting units has been consistently about 1 percent below the actual strength of the Army in this country. The mean strength shown for individual stations is that of Army personnel attached or assigned for medical care and does not include organizations not on the post but dependent on the station for hospitalization.

Because of the desirability of placing the information in circulation at the earliest possible time following its receipt, figures are in general shown herein as reported. Where there is some doubt as to the accuracy of the reported figures, their verification is requested, and the fact that they have been so questioned is indicated by the symbol (!).

MORBIDITY DATA

Admissions are reported only for cases admitted to a medical installation (either to hospital or quarters) and not returned to duty within the same day, except for certain cases carded for record only, (chiefly venereal disease cases treated on a duty status, and deaths which occurred before admission to hospital or quarters). Admissions designated as "injury" comprise all "new" traumatism other than battle casualties (i.e., morbid conditions due to external causes, including poisons taken internally, results of exposure to heat, cold and light, as well as various types of wounds not due to enemy action). Under present conditions there would not be any direct admissions in the continental United States properly classifiable as battle casualties. All cases other than those of injury or battle casualty are classified as "disease."

Admission rates are shown for all causes combined, for all diseases combined, for injuries and for a few specific diseases. These rates are presented on an annual basis to facilitate comparisons with corresponding rates in annual and monthly reports. Such annual rates of admission indicate the number of admissions per thousand mean strength which would occur over a year's time if the current week's experience continued for a year.

The report also shows the number of cases of the more common communicable and certain other diseases of special interest. It may be noted that under the term infectious hepatitis are included cases reported as jaundice and cholangitis. Appended is a list of cases reported for the rarer communicable and certain other diseases.

The average proportion of the daily strength of the command which is confined to hospital or quarters (mean number of non-effectives per thousand strength) is given in the summary table for the total United States and for each of the Service Commands. More significant is the estimated non-effective rate for personnel stationed in the United States shown in the chart on page 7.

The number of enlisted men discharged during the week on Certificates of Disability for Discharge (CDD) are shown for individual stations. These data should be distinguished from the figures for "honorable discharges for physical and mental disqualification" assembled by The Adjutant General's Office; the latter include discharges for inaptness in addition to CDD's and are tabulated on a somewhat different basis (e.g., the April data represent April discharges processed by the AGO during April and May plus discharges prior to April which were processed in May).

In making comparisons between Service Commands it should be borne in mind that morbidity rates naturally tend to be higher in those Service Commands which have a relatively large number of General Hospitals and Ports of Embarkation. The presence of sizeable numbers of troops not under the jurisdiction of a Service Command (e.g. casualties, task force troops, etc.) affects the interpretation of the data from the viewpoint of Command responsibility.

MORTALITY DATA

Recent studies indicate that the reporting of deaths on Forms 86ab is incomplete, especially in the case of deaths from injury. The resulting understatement in the mortality rate from injury may be as much as 15 percent and occasionally even more, but the death rate from disease is not materially understated. Therefore in computing mortality rates from injury and from all causes on the basis of the corresponding numbers of deaths, as shown in this report, an appropriate adjustment for the underreporting of such deaths must be made.

STATIONS WITH HIGHEST MORBIDITY RATES

Included in the report is a table listing the stations (having strength of 5000 or over) with the highest morbidity rates from all causes, from all diseases combined, from injuries, and from a few specific diseases. Not infrequently, the excessively high rates of admission for all causes and for all diseases combined reported from reception centers reflect a large number of venereal disease cases among newly inducted men. Therefore, more significant of high morbidity from disease are the rates of admission for disease excluding venereal infections existing prior to induction, which rates are also shown in the table.

EXPLANATORY MATTER

In reading the detail tables, it should be borne in mind that admission rates based on small numbers of cases are not reliable. For this reason the symbol (?) is placed after admission rates computed on the basis of 5 or fewer cases.

Where the current week's data for a particular station have not been received, the latest available figures are substituted therefor and the symbol (#) is placed after the name of the station.

CONTINENTAL UNITED STATES

COMMENT ON CURRENT TRENDS

CURRENT MORBIDITY IN THE CONTINENTAL UNITED STATES

All Causes: Disease and Injury:

During the week ending 19 January 1945 the admission rate from all causes increased by 3 percent to 677 per year per thousand strength. The current week's morbidity is nevertheless about 20 percent lower than during the corresponding week of 1944 due almost entirely to lower morbidity from respiratory causes.

Morbidity from disease increased during the current week to 622 per thousand which is the highest rate recorded since the middle of March 1944.

The admission rate from injury remained at 55 per thousand which is about the same as the average rate during the last two months. The recent injury experience is not strictly comparable with that reported prior to October 1944 since it in part reflects compliance with the directive issued 29 September 1944, which provided that injuries existing prior to entry into active service and readmitted cases should be recorded under "disease" rather than under "injury"; previously they had been reported as "injuries."

Respiratory Causes:

Morbidity from colds, influenza, etc. increased by 13 percent to 180 per thousand, which is the highest rate recorded since March 1944. The current week's admission rate from these causes is nevertheless about 50 percent lower than during the corresponding week of 1944.

The admission rate from pneumonia increased slightly to 13 per thousand but remained about 40 percent lower than for the corresponding week of 1944.

Common Communicable Diseases:

Morbidity from venereal diseases, excluding cases

contracted prior to entry into active service, decreased from 49 per thousand to 47 per thousand for the current week. This is the second highest rate reported during the last two years.

Morbidity from diarrhea and dysentery was again reported at 7 per thousand, a continuation of the low seasonal level to be expected at this time of the year.

The numbers of new cases of measles, mumps, and scarlet fever continued at about the same level as during the previous week as did also the new cases of meningitis and rheumatic fever. Admissions for infectious hepatitis averaged somewhat less than 60 per week during January which is somewhat less than the average during December.

VARIATIONS IN MORBIDITY BY SERVICE COMMAND

All Causes: Disease and Injury:

The admission rate from disease increased in the majority of the Service Commands; only in the Sixth Service Command was significant decrease reported. The First Service Command was the only one to register an increase of more than 10 percent.

The First and Third Service Commands reported the highest morbidity from all causes (794 per thousand) and from disease (about 740 per thousand), closely followed by the Sixth Service Command. The lowest morbidity from all causes (597 per thousand) was again registered in the Seventh Service Command, which also registered the lowest morbidity from disease (555 per thousand).

The admission rate from injury showed a significant increase only in the Second and Fourth Service Commands. Sharp decreases were registered in the Fifth, Eighth, and Ninth Service Commands and the

COMMENT ON CURRENT TRENDS (CONT'D)

Military District of Washington. The Fourth Service Command reported the highest morbidity from injury (63 per thousand), closely followed by the Eighth Service Command.

Respiratory Causes:

The admission rate from colds, influenza, etc. rose in all Service Commands except the Fifth and Sixth and the Military District of Washington, in which only small decreases were registered. The highest morbidity from these causes was reported by the Fifth and Sixth Service Commands (about 255 per thousand).

Morbidity from pneumonia increased markedly in most Service Commands but sharp decreases were reported by the First and Sixth Service Commands. Nonetheless, the Sixth Service Command continued to report the highest admission rate (23 per thousand).

Common Communicable Diseases:

Morbidity from "new" venereal diseases (excluding EPTS cases) decreased in all Service Commands except the First and Seventh and the Military District of Washington. The greatest decreases were reported by the Third and Sixth Service Commands. The highest morbidity from these causes was reported by the First Service Command (88 per thousand), followed by the Third and Fifth Service Commands (about 65 per thousand).

NON-EFFECTIVE RATE:

The non-effective rate for Army personnel stationed in the Continental United States is estimated at 38.9 per 1000 strength for the week ending 19 January 1945 as compared with approximately 39 per 1000 for the corresponding week of 1944. However, the mean number of non-effectives in this country, including Army patients

evacuated from overseas, rose to 68.3 per thousand for the current week which is the highest recorded for this war.

PATIENTS REMAINING UNDER TREATMENT: 19 January 1945:

The number of neuropsychiatric cases remaining was reported at 27,230 or about 900 more than at the end of the previous week and thus the highest reported so far in this war. The number of non-battle injury patients remaining was reported at about 31,100. The number of battle casualty patients remaining increased by about 1,900 to number 44,920.

CERTIFICATES OF DISABILITY FOR DISCHARGE:

During the week ending 19 January there were 3,637 enlisted men discharged by CDD or about 300 more than the previous week. Nonetheless the current week's level is considerably below the average of about 4500 per week at the beginning of December 1944. About 59 percent of these discharges were reported by General Hospitals. Included among the 3,637 CDD's were 1,431 neuropsychiatric cases.

FORM SG-902 - 8 July 1944

RESTRICTED

COMMENT ON RECENT DEVELOPMENTS

FOR THE FIVE WEEK PERIOD ENDING 29 DECEMBER 1944

NATURE OF THE DATA:

The data of this Monthly Report, like those of the Weekly Health Reports, have been taken from Forms 86ab rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States. However, unlike the Weekly Health Reports which are compiled on the basis of the figures as received, so as to place the information in circulation at the earliest possible time, the figures here presented for the five week period ending 29 December 1944 include the great majority of the corrected reports as well as reports received too late to be incorporated in the Weekly Health Report.

This Report covers morbidity and mortality data for all individual stations with a strength of 1000 or over and gives details for admissions from venereal diseases and for neuropsychiatric cases.

Charts showing morbidity trends from all causes, from all diseases combined, from injury, and from colds, influenza, etc. are presented on page 27. Similar charts for specified diseases appear on pages 29, 31, and 33. A chart showing mortality trends is presented on page 35. A summary for the month of the number of admissions and corresponding morbidity rates and of the number of deaths and corresponding mortality rates for the United States as a whole and for the Service Commands is given on page 38. The most pertinent morbidity data for individual stations are presented on pages 39 to 64. On pages 65 and 66 the seven stations with the highest rates of admission during the month are shown for each of the morbidity categories considered.

In reading the detailed tables, it should be borne in mind that morbidity (or mortality) rates

based on small numbers of cases are not reliable. For this reason the symbol "?" has been placed after rates computed on the basis of 5 or fewer cases. Attention is directed to the definitions of admissions and admission rates and the discussion of the proportion of total Army strength included in the stations covered by this Report as given on page 2. The term "month" in this report is used to denote the four or five week period based on the number of Fridays in the calendar month.

It should be noted that the summary data for 1944 on pages 36 and 37 are provisional; final figures will be presented in the near future.

MORBIDITY FROM ALL CAUSES: DISEASE AND INJURY

Admission rates from all causes and from disease increased slightly (by about 3 percent) in December. The Navy shore stations in the continental United States reported about the same morbidity in December as in November.

The Army's morbidity from disease during December was only about 10 percent above the minimum rate for the year registered during July and August although usually morbidity in December has been well above that of the summer months. The December 1944 admission rate from disease (513 per year per thousand strength) was almost 50 percent below the rate for December 1943, at which time there occurred a sharp outbreak of upper respiratory infections.

The admission rate from injury decreased to 55 per thousand which is the lowest rate on record; however, the recent experience is not strictly comparable with that prior to October 1944 because the subsequent

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

relatively low level of injuries reflects in part at least compliance with the directive issued 29 September 1944 which required readmitted and EPTS injuries to be reported as "disease" and not as "injury."

For the entire year 1944, the admission rate from all causes (630 per thousand) was about 25 percent lower than in 1943. The 1944 admission rate from disease (563 per thousand) was likewise about 25 percent below that for 1943. More than half of the decrease in morbidity from disease during 1944 as contrasted with 1943 was attributable to lower admissions from respiratory causes. Although the change in definition of "injury" was to some degree responsible for the lower morbidity from injury during 1944 (67 per thousand in 1944 as compared with 80 per thousand in 1943), most of the decline represented a lower frequency of accidents.

Higher morbidity from disease during December, as compared with November, was reported by every Service Command except the Third and Ninth which reported fractional decreases. The greatest increase was recorded in the Sixth Service Command which was the only one to register a rise of more than 10 percent.

The Second Service Command reported the highest admission rates from all causes and from disease in December (both being 20 percent higher than for the country as a whole), being closely followed by the Third Service Command. The lowest admission rates from all causes and from disease were again registered in the Eighth Service Command (both about 10 percent under the rates for the country as a whole).

The highest morbidity from injury during December was reported by the Fourth Service Command (65 per thousand); only the Eighth Service Command, in addition to the Fourth, had a rate in excess of 55 per thousand. The lowest admission rates were recorded in the Second

and Third Service Commands and the Military District of Washington, all of which had rates of 40 to 45 per thousand.

RESPIRATORY DISEASES:

During December the admission rate from colds, influenza, etc. rose 25 percent to 115 per thousand, which is the highest rate reported since May. December morbidity from respiratory diseases also increased by about 25 percent at shore stations of the Navy in this country. The Army's admission rate for December 1944 was 80 percent lower than for December 1943 during which month a notable outbreak of common respiratory infections occurred.

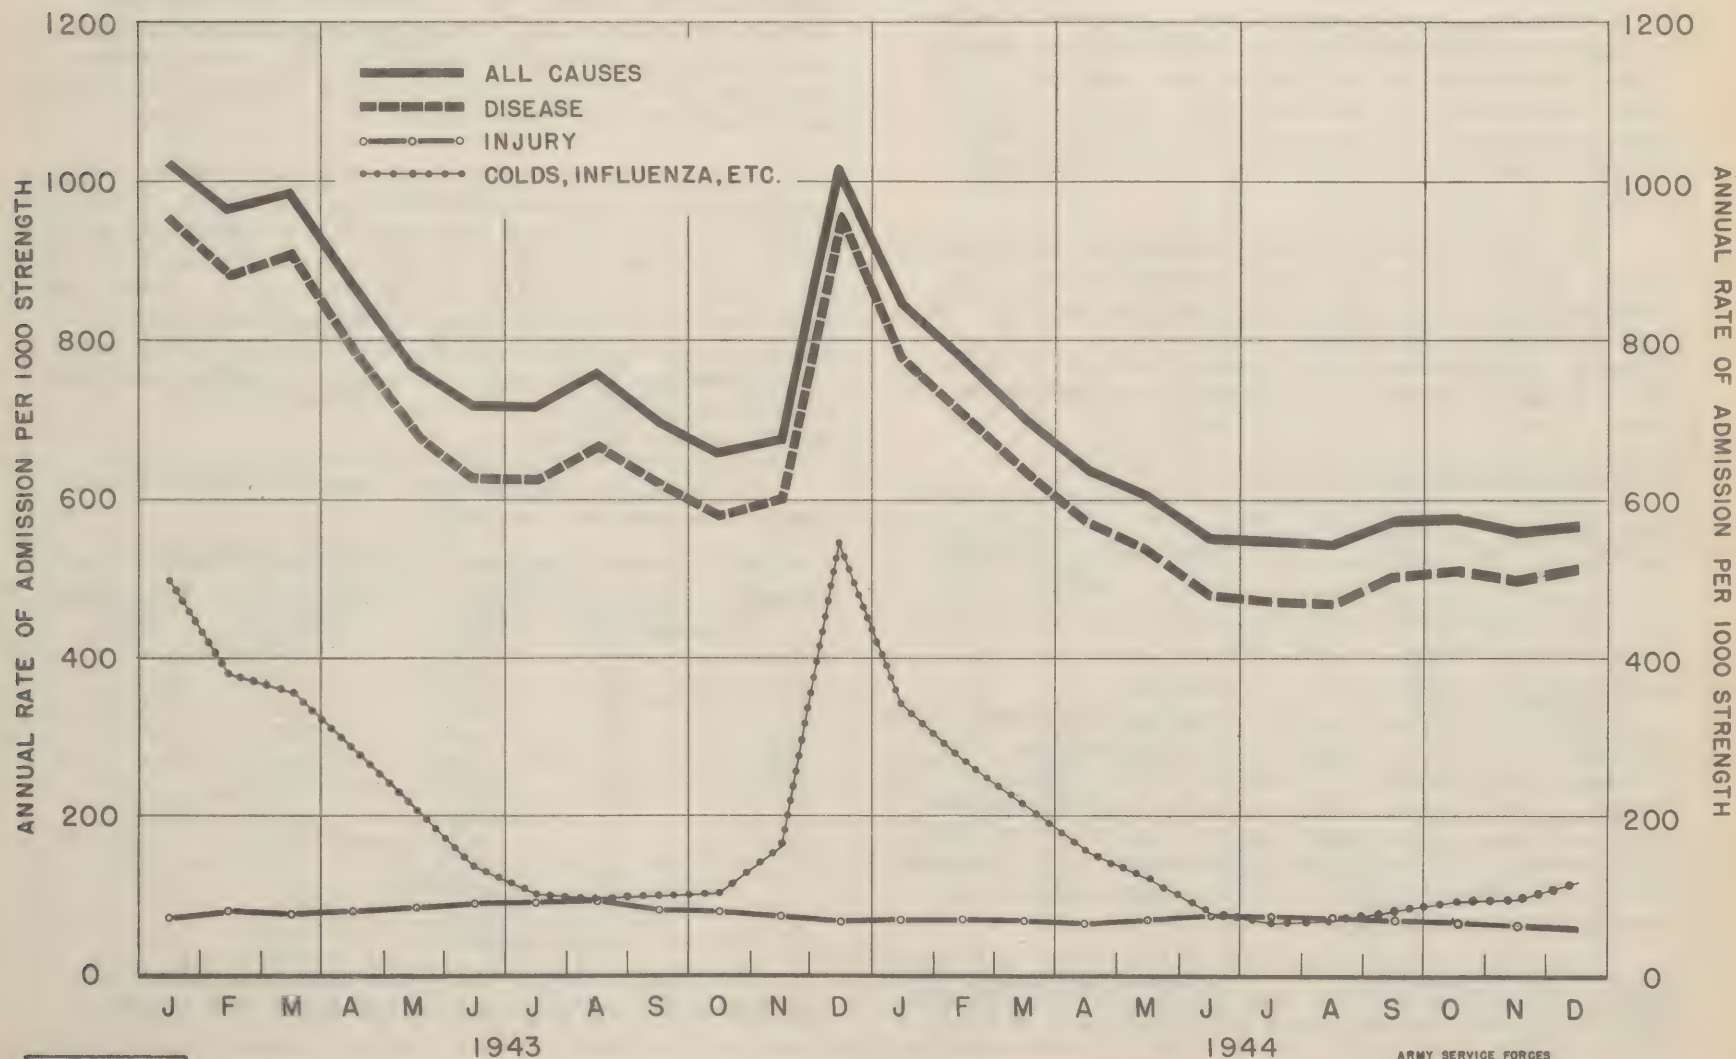

Morbidity from colds, influenza, etc. increased significantly in all Service Commands except the Military District of Washington which reported small decreases. The Sixth Service Command reported the highest morbidity from these causes (162 per thousand) followed by the Second, Third, and Fifth Service Commands and the Military District of Washington (about 135 per thousand); the lowest rates occurred in the Fourth and Seventh Service Commands (about 100 per thousand).

For the entire year 1944 morbidity from colds, influenza, etc. was reported at 147 per thousand or 40 percent under the corresponding rate for 1943. The 1943 experience was higher than that for 1944 not only because of the sharp outbreak in December 1943 mentioned previously, but also because the experience during the winter and spring months was significantly lower in 1944 and this favorable situation continued during the summer and fall months.

Morbidity from all forms of pneumonia combined increased by 10 percent during December. Nonetheless, the admission rate during December 1944 was about 50 percent lower than for December 1943. Morbidity from

MORBIDITY FROM — ALL CAUSES — DISEASE — INJURY — COLDS, INFLUENZA, ETC.

CONTINENTAL UNITED STATES

RESTRICTED

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

this cause was about 25 percent lower during 1944 than during 1943.

Morbidity from pneumonia was higher in December in most Service Commands. The Sixth Service Command again experienced by far the highest admission rate from this cause; the December rate for this command was however about 10 percent lower than in November although nearly double the December rate for the country as a whole.

In December 1944 atypical pneumonia accounted for about two-thirds of all pneumonia admissions. The proportion of pneumonia cases diagnosed as atypical was highest in the Second, Third, Fourth and Eighth Service Commands and the Military District of Washington, in all of which the proportion was 70 percent or over.

DIARRHEA AND DYSENTERY:

Morbidity from diarrhea and dysentery decreased fractionally in December continuing the normal seasonal trend. The admission rate for December 1944 was about 15 percent lower than that for December 1943. For the entire year 1944, morbidity from these causes was about 25 percent lower than for 1943.

VENEREAL DISEASES:

Morbidity from venereal diseases, excluding cases contracted prior to entry into active service, increased fractionally in December to 39.2 per thousand which is the highest admission rate reported since February 1942. The Navy's experience with venereal disease was about the same in December as in November or at a relatively high level as compared with the earlier months of 1944.

The Army's admission rate for syphilis, excluding EPTS cases, remained the same as in November and was at the highest figure since the early part of 1944.

Morbidity from gonorrhea increased slightly.

Notably lower morbidity from venereal diseases, excluding EPTS cases, was reported by the Third and Fifth Service Commands, while markedly higher admission rates were registered in the First and Second Service Commands; most of the other Commands reported about the same experience as in November.

The highest morbidity from venereal disease, excluding EPTS cases, was reported by the First, Second, Third and Fifth Service Commands all of which had rates of about 55 per thousand (or 40 percent higher than for the country as a whole). The first three of these Commands had a relatively high experience because of the presence of task force troops not directly under their jurisdiction. Relatively low admission rates were recorded in the Military District of Washington and the Ninth Service Command.

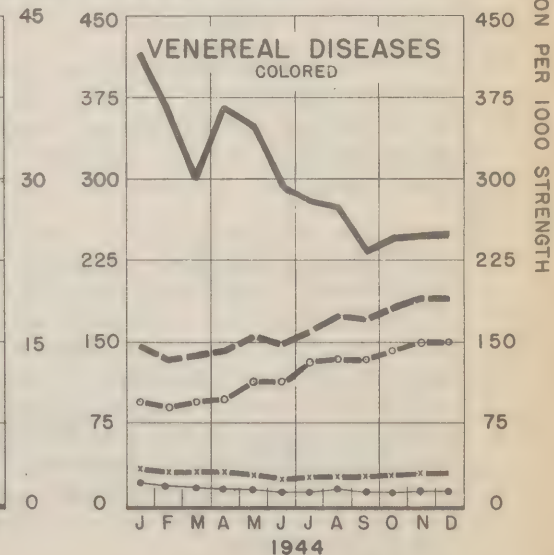

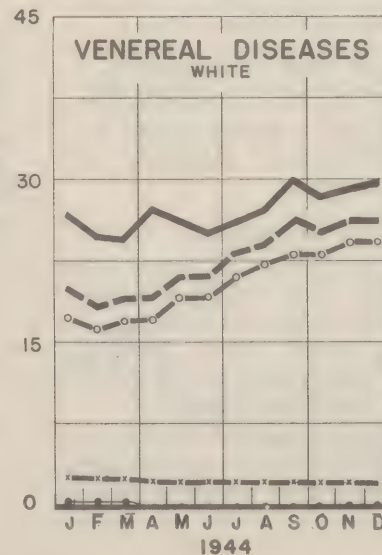

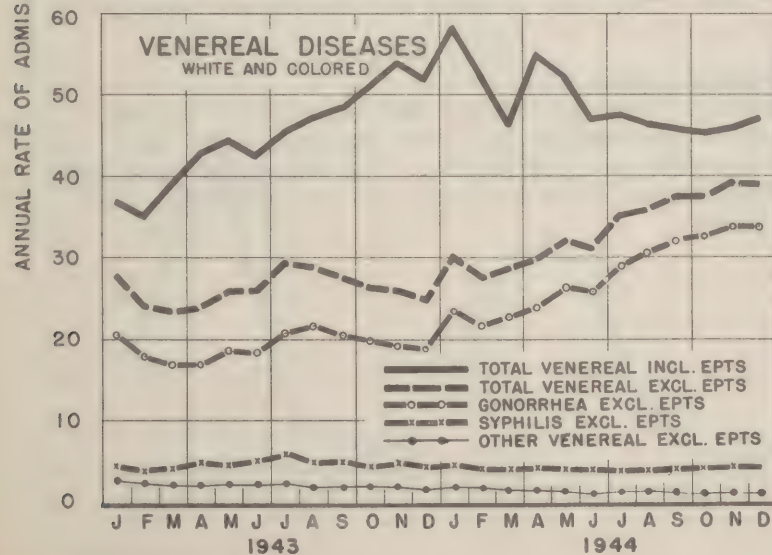

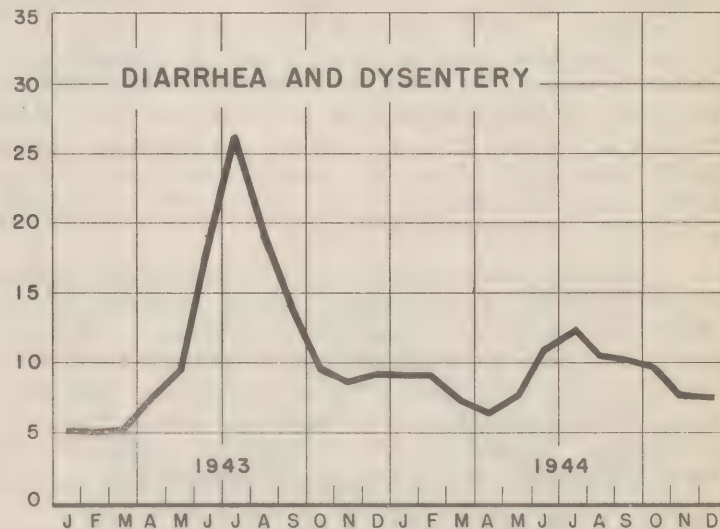

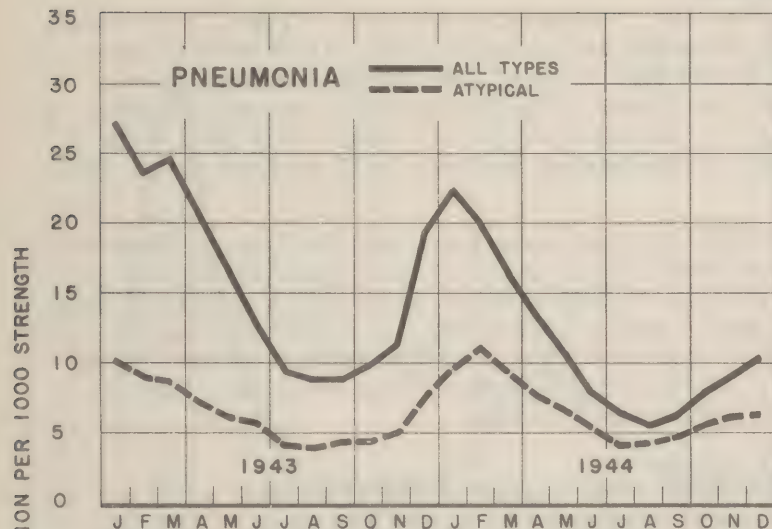

The venereal disease cases remaining under treatment on 29 December are shown below:

Service Command	Number Remaining Under Treatment		Venereal Disease Cases as Percent of all Cases	
	Syphilis	Other	Syphilis	Other
TOTAL U.S.	1415	870	.79	.49
I	57	16	.8	.2
II	68	106	.4	.6
III	232	83	2.0	.7
MDW	17	21	.5	.6
IV	321	151	.8	.4
V	64	91	.4	.5
VI	22	38	.2	.4
VII	70	49	.5	.3
VIII	352	173	1.1	.5
IX	212	142	.8	.5

The great bulk of the cases remaining were contracted after entry on active service. The number of

MORBIDITY FROM ————— PNEUMONIA DIARRHEA AND DYSENTERY VENEREAL DISEASES

CONTINENTAL UNITED STATES

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

syphilis cases remaining at the end of December was about 7 percent lower than for November, while the number of cases of other venereal diseases decreased 20 percent. Total venereal cases represented 1.23 percent of the total number of patients remaining under treatment in hospital. The very much longer duration of hospitalization for syphilis is indicated by the fact that only 11 percent of the total venereal admissions (excluding EPTS cases) were for this cause, even though 60 percent of the cases remaining under treatment were syphilis cases.

Morbidity represented by venereal EPTS cases was reported at 8.4 per thousand during December as compared with 6.8 per thousand for November. The admission rate from this cause has in general been decreasing steadily during recent months as a result of the downward trend in the number of men inducted into the Army. Variations in the admission rate for venereal EPTS cases as between Service Commands have relatively little significance, because they reflect a different geographical and racial distribution of Army personnel as compared with that of new inductees.

The total number of days lost from duty during December because of venereal disease was about 88,000 or an average of 17,500 per week; this represented a non-effective rate of .78 per thousand or slightly lower than for the previous six months.

The very much higher incidence of venereal disease among colored as compared with white personnel is indicated in the chart on page 29. For colored troops in 1944 morbidity from venereal disease, excluding EPTS cases, has been consistently about seven times as high as for the remainder of the Army, while for EPTS cases the colored admission rate has been about 30 times as high. More detailed data as to the November incidence of venereal diseases by color are presented in the Special Health Report contained in Weekly Health

Report No. 51 (page 23).

MEASLES:

Morbidity from measles increased from .1 per thousand in November to .4 per thousand in December, reflecting the beginning of the upward seasonal trend. However, this rate is only about one-quarter as large as that for December 1943. For the entire year 1944 morbidity from measles was only half as high as in 1943.

MUMPS:

Morbidity from mumps more than doubled in December to be reported at 2.9 per thousand, paralleling the sharp seasonal increase which occurred in December 1943. The current level of morbidity is only about one-quarter of the peak rate usually reached in the spring months. Morbidity for mumps during 1944 was about 30 percent lower than in 1943.

SCARLET FEVER:

Morbidity from scarlet fever increased to .8 per thousand in December or by about 50 percent. The admission rate from this disease for 1944 was about 15 percent lower than in 1943.

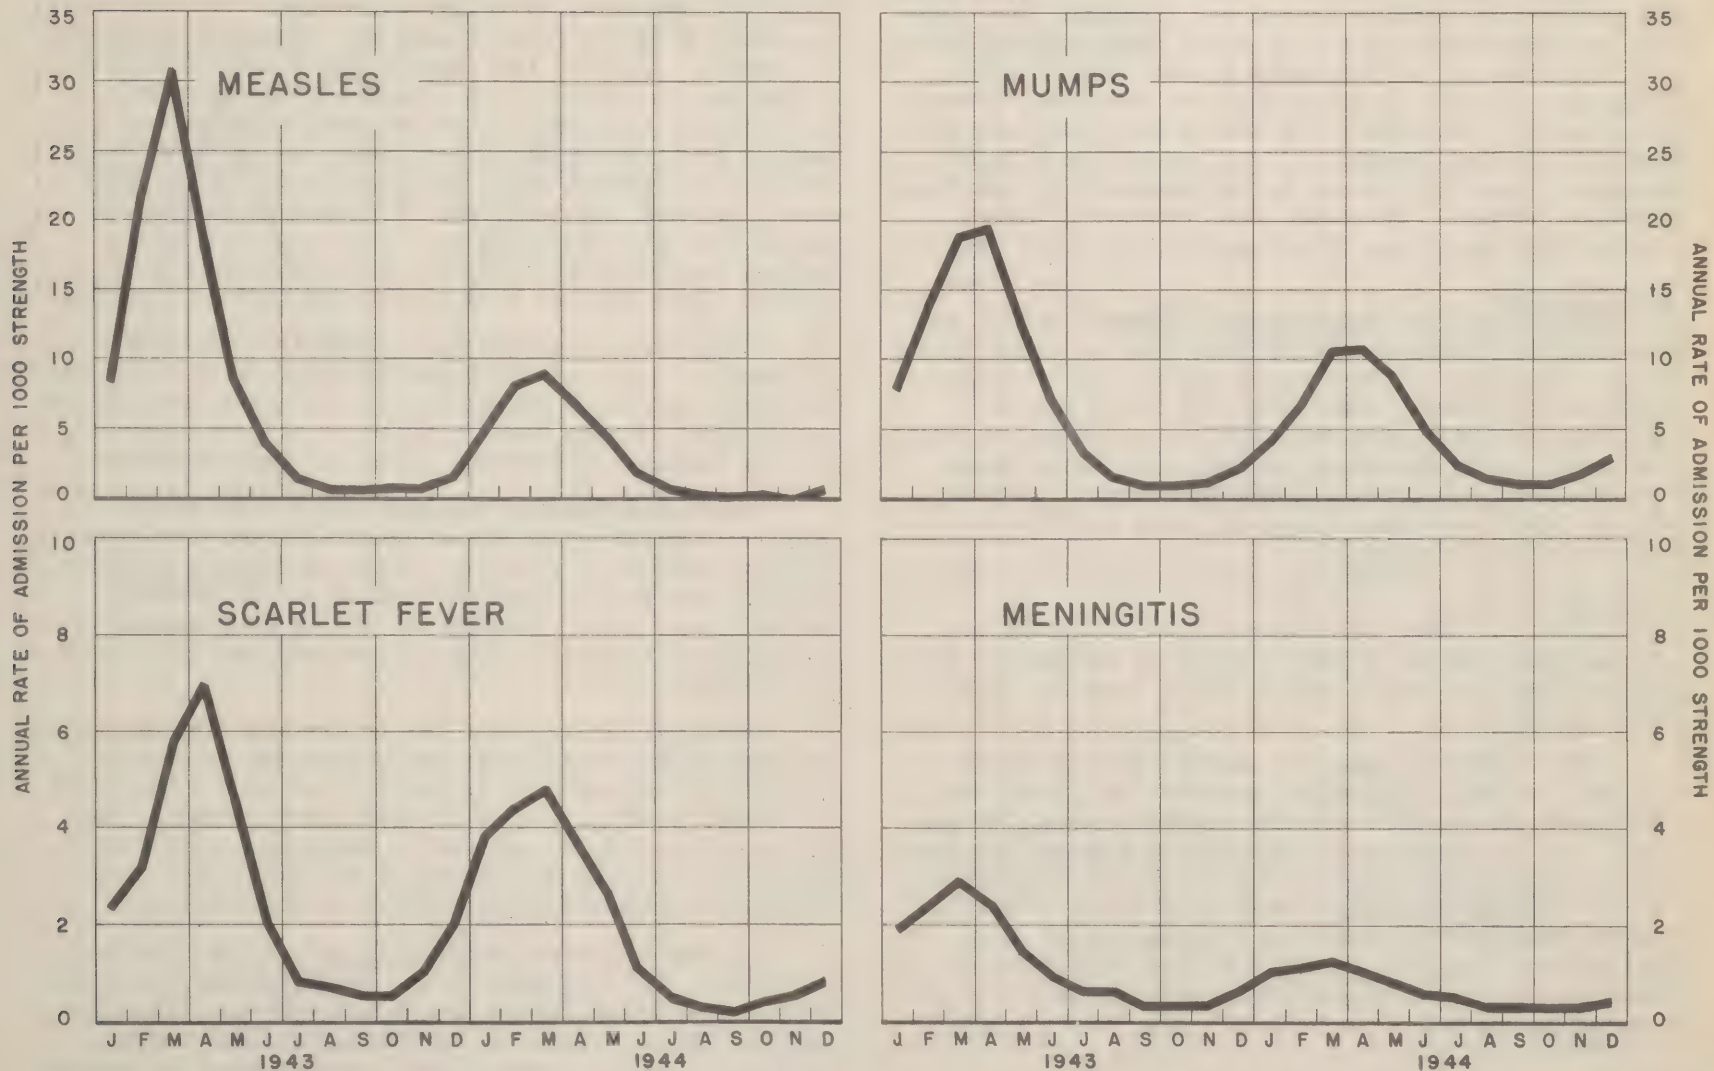

MENINGOCOCCIC MENINGITIS:

Morbidity for meningitis was reported at .4 per thousand in December or on about the same level as during the previous six months. The admission rate for this cause during 1944 was about 40 percent lower than during 1943.

MORBIDITY FROM — MEASLES — MUMPS

SCARLET FEVER — MENINGITIS

CONTINENTAL UNITED STATES

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

RHEUMATIC FEVER:

Morbidity from rheumatic fever increased by about 50 percent in December to 1.2 per thousand, the highest rate reported since July 1944. The largest part of this rise was attributable to the Ninth Service Command which had about one-half of the total cases in the country. For the first time during this war the Seventh Service Command did not report the highest morbidity from this cause being outranked by the Ninth Service Command. Morbidity from rheumatic fever during 1944 was about 25 percent higher than 1943.

TUBERCULOSIS:

Morbidity from tuberculosis remained at 1.1 per thousand in December, the highest rate reported during 1944. However, the experience for the entire year 1944 was 15 percent lower than for 1943. As of 29 December 1944 there were 1505 cases of tuberculosis remaining under treatment in Army hospitals; these represented .84 percent of all patients in hospital. Of the 1505 cases remaining, 487 were at Fitzsimons GH and 629 at Bruns GH.

MALARIA:

Morbidity from malaria acquired in the United States remained at .1 per thousand in December. Morbidity from this cause was slightly lower in 1944 than in 1943.

The number of cases of malaria presumably acquired overseas which were admitted (or readmitted) for treatment in this country averaged about 980 per week, or 10 percent above the weekly average for November and thus the highest figure so far recorded. As of 29 December 1944 there were 2618 cases of malaria under treatment representing 1.5 percent of total patients in hospital. Only 9 of the 2618 cases of malaria were those where the disease was acquired in the United States.

NEUROPSYCHIATRIC DISORDERS:

The annual rate of admission for neuropsychiatric disorders decreased slightly in December (to 47.0 per thousand) from the peak of 48.0 per thousand registered in October. In part the current relatively high level of admissions reflects the effects of WD Cir. 370, 12 September 1944 which provided that enlisted men not meeting minimum standards for induction and having no suitable assignment could be discharged. It is noteworthy however that the rate of discharge for neuropsychiatric disorders has not increased, apparently because many mild psychiatric cases have been discharged under Section X of AR 615-360 (now AR 615-365).

Significant decreases in morbidity from neuropsychiatric disorders in December occurred in the Fifth and Ninth Service Commands and the Military District of Washington. In the Second, Third, Sixth, and Seventh Service Commands noteworthy increases were reported.

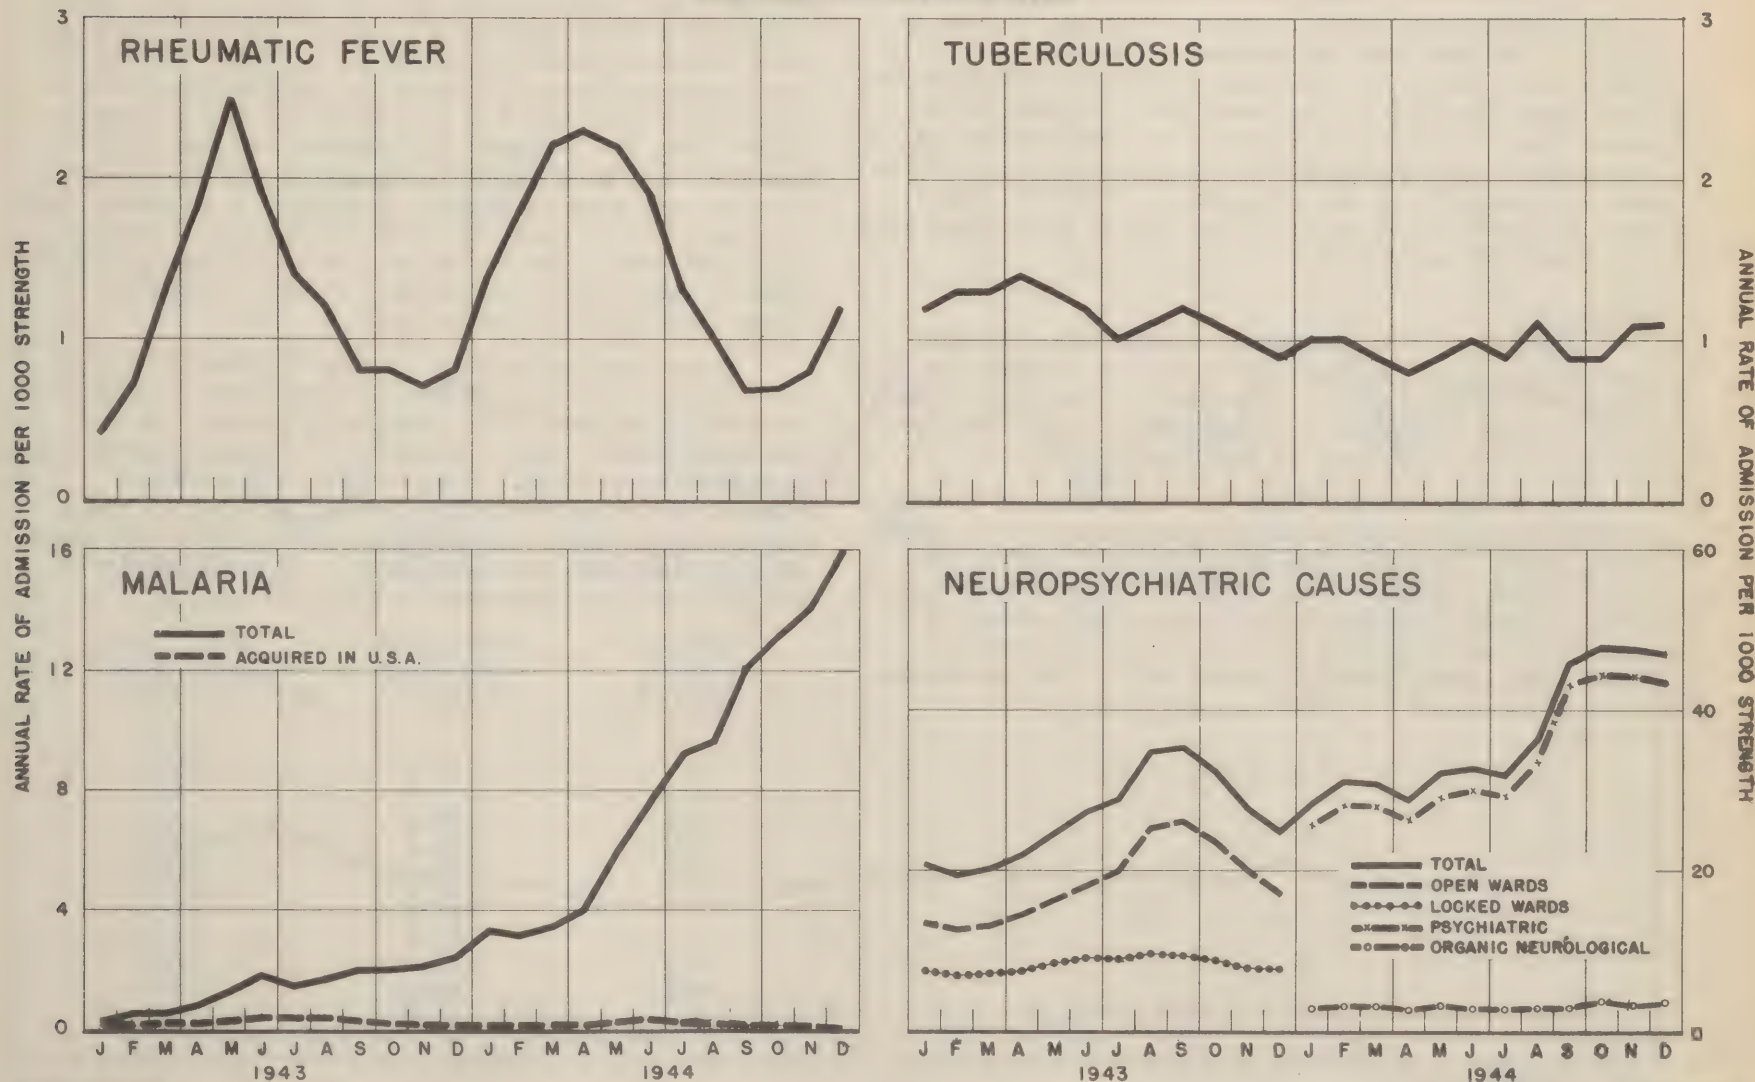

The Second Service Command reported by far the highest morbidity from these causes (87 per thousand) largely because of relatively high admissions at Atlantic City AAF Redistribution Station and at several General Hospitals. The lowest rates were reported by the Military District of Washington and the Fifth Service Command.

During December there was an average of 1560 CDD's per week given to enlisted men classified as neuropsychiatric cases; this is about 15 percent lower than the weekly average during October and November. The CDD's in December in respect to neuropsychiatric disorders represented 37 percent of all CDD's or a somewhat lower proportion than during recent months.

In December organic neurological cases continued to account for 7 percent of all neuropsychiatric cases. Only in the Fifth, Sixth and Seventh Service Commands and the Military District of Washington did the proportion of organic neurological cases exceed 10 percent

MORBIDITY FROM — RHEUMATIC FEVER — TUBERCULOSIS MALARIA — NEUROPSYCHIATRIC CAUSES

CONTINENTAL UNITED STATES

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

of the total neuropsychiatric cases.

The number of neuropsychiatric cases remaining under treatment as of 29 December 1944 was 22,906 or about 3,000 more than at the end of November; this is the highest number of such cases reported so far during this war. Most of the increase was in locked ward cases (principally in the Second Service Command at Mason GH). Neuropsychiatric cases remaining represented 12.8 percent of all patients in hospital; open ward cases were 8.8 percent, and locked ward cases were the remaining 4.0 percent.

MORTALITY:

Mortality from all causes during December was reported at 2.42 per year per thousand strength or about the same as during November. The mortality rate from disease decreased from .68 per thousand in November to .59 per thousand in December.

It should be noted that the reporting of deaths on Forms 86ab is not complete, particularly for deaths from injury for which the understatement may be as great as 15 percent. The mortality rate from injury when adjusted to allow for this under-reporting is about 2.1 per thousand, resulting in an estimated total death rate from all causes of 2.7 per thousand.

NON-EFFECTIVE RATE:

The mean number of non-effectives per thousand strength for December was reported at 55.1 per thousand strength or 9 percent higher than in November; most of this increase arose because of an increase in hospital population at General Hospitals. Despite lower admission rates, the rate for December 1944 was 30 percent higher than for December 1943; this increase is more apparent than real since it is the result of the inclusion of days lost in General Hospitals by evacuees from overseas, who account for over 40 percent of the non-effective rate. The non-effective rate from injury in December was 9.0 per thousand, which is somewhat higher than in previous months.

Variations in the mean number of non-effectives per thousand strength by Service Command do not reflect so much the variations in morbidity between Service Commands as the varying number of General Hospitals in each Service Command. When comparisons are made between the rates excluding General Hospitals, the variations by Service Command are seen to be very much smaller than when the days lost in General Hospitals are included, as evidenced in the table below:

<u>Service Command</u>	<u>Including Gen. Hosp.</u>	<u>Excluding Gen. Hosp.</u>
TOTAL U.S.	55.1	27.3
I	71.5	21.7
II	77.1	25.0
III	63.9	35.1
MDW	71.6	15.0
IV	48.3	31.2
V	133.0	27.2
